this text extensively class tested over a decade at uc berkeley and uc san diego explains the fundamentals of algorithms in a story line that makes the material enjoyable and easy to digest emphasis is placed on understanding the crisp mathematical idea behind each algorithm in a manner that is intuitive and rigorous without being unduly formal features include the use of boxes to strengthen the narrative pieces that provide historical context descriptions of how the algorithms are used in practice and excursions for the mathematically sophisticated carefully chosen advanced topics that can be skipped in a standard one semester course but can be covered in an advanced algorithms course or in a more leisurely two semester sequence an accessible treatment of linear programming introduces students to one of the greatest achievements in algorithms an optional chapter on the quantum algorithm for factoring provides a unique peephole into this exciting topic in addition to the text dasgupta also offers a solutions manual

which is available on the online learning center algorithms is an outstanding undergraduate text equally informed by the historical roots and contemporary applications of its subject like a captivating novel it is a joy to read tim roughgarden stanford university

algorithms are essential building blocks of computer applications however advancements in computer hardware which render traditional computer models more and more unrealistic and an ever increasing demand for efficient solution to actual real world problems have led to a rising gap between classical algorithm theory and algorithmics in practice the emerging discipline of algorithm engineering aims at bridging this gap driven by concrete applications algorithm engineering complements theory by the benefits of experimentation and puts equal emphasis on all aspects arising during a cyclic solution process ranging from realistic modeling design analysis robust and efficient implementations to careful experiments this tutorial outcome of a gi dagstuhl seminar held in dagstuhl castle in september 2006 covers the essential aspects of this process in ten chapters on basic ideas modeling and design issues analysis of algorithms realistic computer models implementation aspects and algorithmic software libraries selected case studies as well as challenges in algorithm engineering both researchers and practitioners in the field will find it useful as a state of the art survey
